About Morningstar Indexes	32

Overview

Designed to facilitate performance benchmarking and efficient portfolio construction, the Morningstar Target Market Exposure (TME) Indexes represent the top 99% of the investable global equity market and provide extensive building blocks across geographical regions, developed and emerging markets, individual countries, sectors, and currencies. The indexes are built and maintained according to a transparent set of rules, and only liquid stocks that are readily available to institutional investors are included, ensuring accurate and objective representation of the investment opportunity set for active managers and mitigating transaction costs for passive investors.

These indexes do not incorporate environmental, social, or governance criteria.

Index Inception and Performance Start Date

The index inception dates and performance start dates are listed in Appendix 9.

Index Construction

Methodology Summary

Starting Universe

- Companies are assigned to countries by considering their country of incorporation and country of primary listing
- Eligible share classes of companies listed on major exchanges in countries classified as developed or emerging markets form the starting universe

Eligibility

- Securities with 10/20 (U.S./non-U.S.) or more nontrading days in the three months preceding reconstitution, or with less than 10% of their shares publicly floated are excluded
- Securities are ranked by trading volume and turnover within their respective region. Those that rank below the top 75% are ineligible

Portfolio Construction

- Securities are ranked by market cap in descending order size within their respective region, and a cumulative market cap percentage is calculated for each stock
- Breakpoints are determined as follows:
 - large-cap: 70%
 - mid-cap: 85%
 - small-cap: 99%
 - The standard indexes in this family include large- and mid cap
- Constituents are weighted by float-adjusted market cap
- Semi-annual reconstitution, quarterly rebalancing

Morningstar Target Market Exposure Indexes

Starting Universe

At each reconstitution, the Morningstar Target Market Exposure Indexes are derived from the starting universe described below.

- **Exchange:** The security must trade on one of the major global exchanges. A complete list of eligible exchanges is provided in Appendix 6.
- **Security type:** All listed securities, including income trusts in Canada, real estate investment trusts, and preferred shares that exhibit characteristics of equity securities, are generally eligible. American depository receipts, or ADRs, are eligible for inclusion if no local equity listing is available for the company in the investable securities. Please see Appendix 5 for a full list of eligible security types by country. The following security types do not qualify:
 - mutual funds
 - exchange-traded funds
 - derivatives
 - convertible notes, warrants, and rights
 - limited partnerships
 - depository receipts, except Swedish depository receipts, Philippine depository receipts and American depository receipts

- **Country classification:** The security must be assigned to an eligible country. Countries are admitted or removed from the index according to a structured review process performed annually in August and are classified as developed or emerging. For more details on framework and the list of developed- and emerging-market countries, refer to Appendix 3 and 4.

Each security is assigned to a single country using a rules-based approach. The country classification for any security is defined primarily by the country of incorporation of the issuing company and the country of primary listing of the security. In addition, if a company is incorporated in a developed-market country in Europe and has its security's primary listing in another developed-market European country, the security will be assigned to its country of primary listing. Nearly 98% of the securities in the Morningstar global equity securities are classified using this approach.

For the remaining cases, in which a company is incorporated in one country, but the primary listing of its securities is in a different country, additional factors are considered to determine the country classification:

- **Primary business and listing country:** If a security has a listing in the country where its primary business is conducted, as measured by maximum single revenue segment, the security will be assigned to its country of listing and primary business location.
- **Tax havens:** To benefit from legal, tax, and/or regulatory advantage, companies may incorporate in a country with limited or no public domestic equity market such as Bahamas or Bermuda. For such cases, the security is classified in the country of its primary listing. A complete list of countries that have been determined to provide these benefits can be found in Appendix 7.
- **China classification:** Securities will be classified to China if the company is incorporated in the People's Republic of China, or PRC, and listed on the Shanghai or Shenzhen stock exchanges as B shares or listed on the Hong Kong stock exchange as H shares, or listed¹ on the Shenzhen or Shanghai Stock exchanges as A shares. To provide investors with exhaustive China coverage and remain true to the underlying risks associated with the business, the following exception is made to the country of incorporation and country of primary listing agreement rule.
- Securities will be classified to China if the company is incorporated outside the PRC but has a listing in the U.S., Singapore, or Hong Kong, provided it meets the following criteria:
 - If a company is listed in the U.S. or Singapore, but has the majority of its business as measured by single revenue segment contributing 50% or more from China and is headquartered in China.
 - If the company is listed in Hong Kong and meets the following definitions:
 - **Red chip:** Company is directly or indirectly controlled by organizations or enterprises that are owned by the state, provinces, or municipalities of the PRC.
 - **P chip:** A company satisfying at least two of the following conditions:
 - The company is controlled by PRC individuals
 - The company derives more than 80% of its revenue from the PRC
 - The company allocates more than 60% of its assets in the PRC.

¹ Starting from June 2020 reconstitution, China A shares trading via the northbound route on Shanghai and Shenzhen Stock Exchanges, and on the Buy and Sell List, are eligible for inclusion

Eligibility

To be eligible for the indexes, all constituents must meet the following criteria:

- Trading frequency:
 - Global ex-U.S.: New securities qualify for the investable universe if they have fewer than 20 nontrading days in the six calendar months immediately before reconstitution. For corporate entities younger than six months, the criterion is applied on a prorated basis.
 - Current constituents are provided a one-time buffer and will remain in the investable universe if they have fewer than 30 nontrading days in the prior six months. The buffer is designed to help reduce turnover in the investable universe caused by a marginal and temporary decline in the number of trading days. Current constituents retained because of the buffer in the previous reconstitution would remain in the investable universe if they have fewer than 20 nontrading days in the prior six months.
 - U.S.: Securities qualify for the investable universe if they have fewer than 10 nontrading days in the last quarter immediately before reconstitution.
- Trading volume and turnover:
 - A security's traded value score, or TVS, must rank in the top 75% of the starting universe (omitting stocks that fail the trading frequency screen) in its respective region: US, Developed ex-US and Emerging Markets. TVS is the average of the rank on the following measures:
 - The average of monthly dollar traded value, or AMDTV, for the six calendar months immediately before reconstitution. Monthly dollar traded value, or MDTV, is the product of the average of number of shares traded in the month and the closing price of the security as of the last trading day of the month. For corporate entities younger than six months, MDTV is computed on a pro rata basis.
 - The two lowest MDTV in the six calendar months immediately before reconstitution (the months need not be sequential).
 - The average monthly turnover ratio, or AMTR, during the six calendar months immediately before reconstitution. AMTR is AMDTV divided by float market value, in U.S. dollars, as of the end of the last trading day before reconstitution. This measure is not used to calculate TVS for US securities.
 - The liquidity criterion is waived in cases of certain corporate events, such as takeovers or spin-offs, where the successor entity issues one or more securities that meets any of the following criteria:
 - The new entity qualifies for index membership in either the large-, mid-, or small-cap band.
 - The new entity's free-float market-capitalization value is greater than or equal to the smallest free-float market capitalization in the small-cap band.
- Free float minimum: Each security must have a free float greater than 10%. For more details on Morningstar's definition of free float, refer to Appendix 8.
- Equity Market Cap Cutoff Calculation:
 - Minimum Equity Market Cap Cutoff is calculated as of every reconstitution cutoff date based on the following steps:

- The companies within the developed markets eligible universe are sorted in the descending order of the full market capitalization and the cumulative coverage of the free float market capitalization is calculated.
 - When the cumulative free float market capitalization coverage of 99% is achieved, the full market capitalization of the corresponding company is defined as the Minimum Equity Market Cap Cutoff.
- Every security must have a company full market cap greater than the Minimum Equity Market Cap Cutoff determined above.
- The security-level float market cap must also greater than 50% of the Minimum Equity Market Cap Cutoff.
- Companies with multiple share classes
 - All trading classes that meet the general eligibility criteria are considered for inclusion.
 - The market capitalization of a company is determined by aggregating all listed share classes. This aggregate market capitalization is used to assign companies to market-capitalization bands, described in detail in the following section.
 - The weight contribution of a given share class in an index is based on the free-float market capitalization of that share class.

Each security that meets the selection criteria above is considered for one of two economic segment indexes: developed or emerging. The country classification process previously described determines membership in the appropriate index. The Morningstar Global All Cap Target Market Exposure Index covers the developed and emerging market segments.

More granular, regional, country, and size segment indexes are derived from the constituents of the Morningstar Global All Cap Target Market Exposure Index. The standard Morningstar TME Indexes include large- and mid-cap stocks, while the all-cap indexes include large-, mid- and small-cap stocks. For the list of TME indexes and their respective market coverage, refer to Appendix 9.

Portfolio Construction

Calculating the Economic Segment-Level Capitalization Breakpoints

Companies in the developed markets economic segment are ordered by company full market cap in descending order, and the cumulative free float company market cap is calculated. Upper and Lower bounds for each capitalization are calculated as follows:

- Developed Markets:
 - Large-cap: If the cumulative free float company market cap of the security ranked at the large-cap minimum size reference at the last reconstitution falls between 70% and 71%, the existing rank is retained as the large-cap minimum size reference. If that level is less than 70%, the minimum size reference is reset to 70%. If it is greater than 71%, it is reset to 71%.
 - Mid-cap: If the cumulative free float company market cap of the security ranked at the mid-cap minimum size reference at the last reconstitution falls between 85% and 85.5%, the existing rank is retained as the mid-cap minimum size reference. If that level is less than 85%, the minimum size reference is reset to 85%. If it is greater than 85.5%, it is reset to 85.5%.
 - Small-cap: If the cumulative free float company market cap of the security ranked at the mid-cap minimum size reference at the last reconstitution falls between 99% and 99.25%, the existing rank is retained as the small-cap

minimum size reference. If that level is less than 99%, the minimum size reference is reset to 99%. If it is greater than 99.25%, it is reset to 99.25%.

- Emerging Markets
 - The emerging markets size cutoffs are 0.5 times the cutoffs calculated for developed markets.
- An upper and lower bound is taken around each of the capitalization breakpoints (large, mid, and small). The upper bound is 1.15 times the breakpoint, and the lower bound is 0.5 times the breakpoint. For example, if the developed-market large-capitalization breakpoint is \$10 billion, then the upper bound is \$10 billion * 1.15 = \$11.5 billion and the lower bound is \$10 billion * 0.5 = \$5 billion.

Calculating the Country-Level Capitalization Breakpoints

The capitalization breakpoints calculated in the previous section are applied within each country to arrive at the country-specific capitalization breakpoints. For each country, the companies are ordered by company full market cap in descending order, and the cumulative free float market-capitalization percentages for the companies are calculated. The market capitalization of the largest stock whose cumulative cap percentage is greater than the following values is taken as the initial capitalization breakpoint for that cap band:

- Large-cap: 70%
- Mid-cap: 85%
- Small-cap: 99%

If the initial country-specific breakpoint is smaller than the economic segment-level capitalization lower bound, then the country-specific breakpoint is set to the economic segment-level capitalization lower bound. If the initial country-specific breakpoint is between the upper economic segment-level capitalization and lower economic segment-level capitalization bounds, then no adjustment is made. If the initial country-specific breakpoint is above the upper economic segment-level capitalization bound, the country-specific breakpoint is set to the economic segment-level capitalization upper bound.

Assigning Companies to Capitalization Bands

The adjusted country-level capitalization breakpoints calculated in the previous section are applied within each country to assign companies to one of three capitalization bands: large, mid, and small. All companies that have a market capitalization greater than the large-cap adjusted capitalization breakpoint are assigned to that large-cap band. The same goes for the mid- and small-cap bands.

Capitalization Bands Buffer

A buffer is applied around the capitalization bands to reduce turnover from small changes in market capitalization.

- An existing constituent is retained in its current size segment if its company full market capitalization is more than 0.67 times the country-specific size segment breakpoint.
- A new constituent is included in the size segment index only if its company full market capitalization is more than 1.5 times the country-specific size segment breakpoint.

Number of Stocks

The number of stocks in the indexes is variable, subject to the selection and eligibility criteria at the time of reconstitution.

Index Weighting

These indexes are float market capitalization weighted. Some target market exposure indexes apply capping, denoted as B-A-C. This means no single constituent can have a weight greater than A and the sum of those with weights greater than B cannot exceed C. For more details, refer to [the Morningstar Indexes Calculation Methodology rulebook](#).

For Morningstar Brazil Target Market Exposure Capped Index, 5-10-40 capping is applied on individual constituents with a buffer of 10%. If 5-10-40 capping is breached at rebalancing, the individual constituent weight is capped at 9% and constituents with weights greater than 4.5% cannot exceed 36% of the portfolio weight. In the event of a breach of this cap, securities above the cap are downweighted to bring the portfolio into compliance. The excess weight from these capped stocks is redistributed across the portfolio in a manner designed to preserve the relative exposure of the pre-capped weights for as many securities as possible. This may result in some securities that initially breached the cap receiving a lower weight than the cap.

China A securities included in the large- and mid-cap indexes are added at partial inclusion factor of 0.25 (i.e. the float market capitalization of China A securities are multiplied by factor of 0.25 for their weighting).

Morningstar US Target Market Exposure Equal Weighted Index, Morningstar Global Target Market Exposure Equal Weighted Index, and Morningstar Global ex-US Target Market Exposure Index are equal weighted.

Index Maintenance and Calculation

Scheduled Maintenance

The indexes are reconstituted, where the membership is reset, semi-annually on the third Friday of June and December. Adjustments are implemented after Friday's market close and reflected the following Monday. If Monday is an index holiday, reconstitution is reflected the next business day. The market data used for reconstitution is as of the last trading day of April and October.

The indexes are rebalanced quarterly on the third Friday of March, June, September, and December. Adjustments are implemented after Friday's market close and reflected the following Monday. If Monday is an index holiday, the rebalance is reflected the next business day. The market data used for rebalancing is described in the [Free Float Calculation Methodology](#).

Refer to Appendix 2 for details on reconstitution and rebalancing.

Index files are published according to the global calendar schedule, meaning index files will be published every day from Monday to Friday throughout the year, even on local market holidays.

IPO Treatment

At each reconstitution in June and December, securities with initial public offerings, or IPOs, listed on or before the last trading day of April and October are eligible for inclusion in Morningstar indexes if they meet all other eligibility criteria. The liquidity criteria are assessed on a pro-rata basis based on the IPO date.

At each rebalance in March and September, significant IPOs are included in the indexes. Significant IPOs are broadly defined as securities that meet the general liquidity and investability criteria and have full market value (in USD), greater than or equal to twice the mid-small segment cutoff of the respective economic segment from the previous reconstitution. The data cutoff date for significant IPOs is the last trading day of February and August.

Corporate Actions

The treatment of corporate actions will be as per the float market-capitalization-weighted indexes. For more details, please refer to the [Morningstar Indexes Corporate Actions Methodology rulebook](#).

Index Calculation and Price Data

Details about index calculations and price data can be found in their respective rulebooks: [Morningstar Indexes Calculation Methodology](#) and [Equity Closing Prices Used for Index Calculation](#).

Methodology Review and Index Cessation Policy

The index methodology is continually reviewed to ensure it achieves all stated objectives. These reviews consider corporate action treatment, selection, and maintenance procedures. Subscribers to the index will be notified before any methodology changes are made. For more details, refer to the [Morningstar Index Methodology Change Policy](#).

Morningstar Indexes notifies all subscribers and stakeholders of the index that circumstances might arise that require a material change to, or a possible cessation of, the index. These circumstances are generally not within Morningstar's control and may include significant changes to the underlying market structure, inadequate access to necessary data, geo-political events, and regulatory changes. In addition, factors such as low usage or methodology convergence may result in the cessation of an index.

Because the cessation of the index or benchmark index could disrupt subscriber products that reference this index, all subscribers are encouraged to have robust fallback procedures if an index is terminated. For more details, refer to the [Morningstar Index Cessation Process](#).

Data Correction and Precision

Intraday Index Data Corrections

Commercially reasonable efforts are made to ensure the accuracy of data used in real-time index calculations. If incorrect price or corporate action data affects index calculations, corrections are applied prospectively.

Index-Related Data and Divisor Corrections

Incorrect pricing and corporate action data for individual issues in the database will be corrected upon detection. In addition, an incorrect divisor of an index, if discovered within two days of its occurrence, will always be fixed retroactively on the day it is discovered to prevent an error from being carried forward. Commercially reasonable efforts are made to correct an older error subject to its significance and feasibility.

For more details, refer to the [Recalculation Guidelines](#).

Exceptions

While Morningstar will seek to apply the method described above, the market environment, supervisory, legal, financial, or tax reasons may require an alternative approach to be adopted. A decision to take an alternative approach will be made by the relevant Morningstar Indexes Methodology Committee, and in all instances, the application of a nonstandard process will be reported to the Morningstar Indexes Oversight Committee.

Appendix 2: Glossary

Terms	Description
Reconstitution	<p>Each reconstitution involves the following:</p> <ul style="list-style-type: none"> Updating the global market's investable equity securities. Reviewing the economic segment- and country-level size segment breakpoints. Assigning companies to capitalization bands considering the buffer zones. Changes in index shares (free float, total shares outstanding, index-specific adjustment factor) of each constituent.
Rebalance	<p>During each rebalance, the weights are adjusted for updated free-float and shares outstanding data.</p>

Appendix 3: Country Inclusion Framework

Morningstar indexes maintains a watch list containing markets under consideration for a possible change in their classification and carries out an annual review for all such countries, in consultation with clients. The Morningstar Index Operations Committee reviews all potential changes. Notifications of changes are provided, at least 90 days in advance, where possible. This framework considers three main criteria:

- Degree of economic freedom
 - A score of 50 or above from the Index of Economic Freedom.
- Country income
 - A high- or middle-income country classification from the World Bank.
- Depth of equity markets
 - More than \$5 billion in market capitalization.
 - Ratio of market capitalization/GDP must be among the top 80%.

Index of Economic Freedom

The Index of Economic Freedom is a joint study by the Heritage Foundation and *The Wall Street Journal* that measures countries according to 10 factors of economic freedom:

- business freedom
- fiscal freedom
- monetary freedom
- financial freedom
- freedom from corruption
- trade freedom
- government size
- investment freedom
- property rights
- labor freedom.

World Bank Country Classification

For operational and analytical purposes, the World Bank's main criterion for classifying economies is gross national income, or GNI, per capita. The bank's analytical income categories (low, middle, and high) are based on the bank's operational lending categories (civil works preferences, International Development Association eligibility, and so on.) These operational guidelines were established three decades ago based on the view that since poorer countries deserve better conditions from the bank, comparative estimates of economic capacity needed to be established. GNI, a broad measure, was considered the best single indicator of economic capacity and progress; at the same time, it was recognized that GNI does not, by itself, constitute or measure of welfare or success in development. GNI per capita is therefore the bank's main criterion of classifying countries.

Country Market Capitalization and Country Market Capitalization/GDP Ratio

The size of a country's equity markets should be material, or above \$5 billion. The market should exhibit financial depth; that is, the ratio of the size of the country's equity markets to its gross domestic product should be high. Countries that fall in the bottom 20% are ineligible for the index.

Additional Country Inclusion Criteria

The following criteria are considered when determining country eligibility:

- the country's allowance of foreign investors to easily enter and exit the market, as well as to repatriate capital and dividends
- timely and accurate availability of real-time and historical market data
- the level of interest attracted by the market from international investors.

Appendix 4: Developed- and Emerging-Market Classification

Countries are classified as developed if they meet all the following criteria:

- annual per capita GNI falls in the high-income category, as defined by the World Bank, for the most recent three years
- the country must not have in place any broad-based discriminatory controls against nondomiciled investors for the most recent three years.
- The country's stock market must exhibit these characteristics:
 - transparency
 - market regulation
 - operational efficiency
 - absence of broad-based investment restrictions.

Eligible countries that do not meet all the above criteria fall into the emerging-markets economic segment. For example, a country may be classified as high income by the World Bank, but because of a lack of transparency within local markets, it falls into the emerging-markets economic segment.

Appendix 8: Free Float

Morningstar defines free float as the number of shares (or percentage of shares) that are, theoretically, available for the public to purchase. In general, the shareholdings can be classified in two broad categories of holders: institutional holders and declarable stakeholders. The latter hold shares for various tactical or speculative reasons (other than those that might typify why an institutional investor would own the shares). As a result, the shares held by declarable stakeholders are, theoretically, unavailable to the public and therefore excluded from free float.

The formula for calculating free float is:

Free float = (total shares outstanding) – (total declarable stakeholder shares)

The following are typically classified as declarable stakeholders:

- officer/director
- joint venture
- private company
- private equity fund/alternative investment
- public company stake
- employee stock ownership fund
- holding company
- government
- sovereign wealth fund
- subsidiary
- trust/trustee
- venture capital fund.

Securities with a free float of 10% or lower are not considered for the index.

Foreign Ownership Limits

For some companies, certain restrictions may apply to nondomestic investors that limit their opportunity to invest. Such restrictions, known as foreign share ownership limits, can be set by government regulation, company bylaws, or local laws. Morningstar float is adjusted for foreign ownership limits and will be the lower of the company float or the foreign ownership limit.

For India, securities on the Reserve Bank of India's caution list and ban list are not eligible for the index. An existing index constituent that moves to the RBI ban or caution list is deleted from the index with a suitable advance notification.

Appendix 9: Individual Indexes

Index Name	Target Exposure %	Inception Date	Performance Inception Date
Morningstar Global Target Market Exposure Index	Top 85	01-May-18	20-Jun-08
Morningstar Developed Europe Target Market Exposure Index	Top 85	01-May-18	20-Jun-08

"**Morningstar China A TME targets the China A shares represented in Morningstar China TME. The index is weighted by float-adjusted market capitalization, reflective of foreign ownership limits."

Appendix 10: Sanctioned Securities

Securities of companies that have been sanctioned or put on a trading prohibition list by the local regulators would be reviewed on case-by-case basis. The removal of affected securities from Morningstar Indexes in between rebalance periods may be required to ensure their ongoing replicability. Such removals will be reviewed and approved by the Morningstar Indexes Methodology Committee and communicated to clients via notifications and corporate action data files where available.

The following sanctions led to removal of securities from Morningstar Indexes:

- The Office of Foreign Assets Control, or OFAC, and the European Union, or EU, imposed sanctions on certain Russian securities in 2014.
- The US President Executive Order (EO 13959) prohibited investments in Chinese Communist Military Company securities on Nov. 12, 2020.
- The Office of Foreign Assets Control (OFAC), the European Union (EU), and the United Kingdom (UK) imposed sanctions on Russian securities in response to Russia's invasion of Ukraine in 2022.

About Morningstar Indexes

Morningstar Indexes was built to keep up with the evolving needs of investors—and to be a leading-edge advocate for them. Our rich heritage as a transparent, investor-focused leader in data and research uniquely equips us to support individuals, institutions, wealth managers, and advisors in navigating investment opportunities across major asset classes, styles, and strategies. From traditional benchmarks and unique IP-driven indexes to index design, calculation, and distribution services, our solutions span an investment landscape as diverse as investors themselves.

Morningstar Indexes Methodology Committee

The Morningstar Index Methodology Committee oversees all new index development, index methodology changes, and cessation of indexes for any indexes where Morningstar owns the intellectual property. This committee is also charged with ensuring that indexes align with Morningstar Research principles and values. The group comprises members of the index team with index research, product development, product management, client service, index implementation, and operation expertise who provide the first layer of governance over index design and methodology.

Morningstar Indexes Operations Committee

The Morningstar Index Operations Committee governs the processes, systems, and exception handling of the day-to-day management of all live indexes, including index rebalancing and reconstitution, restatements, market classification, and contingency management. The committee oversees the annual review of index methodology (as required by U.K. and EU benchmark regulations, or BMR), ensuring that methodologies remain fit for purpose and continue to achieve their stated investment objectives. The group comprises members of the index team with data, operations, corporate actions, product development, index launch, client service, and index management experience who provide the first layer of governance over index operations.

Morningstar Indexes Oversight Committee

The Morningstar Index Oversight Committee is responsible for the index oversight function as per the requirements of the U.K. and European BMR, providing independent oversight of all aspects of the governance of benchmark administration as required by the relevant BMR. Its remit extends to all calculation and administration-related business activities of Morningstar Indexes, including administration of Morningstar-owned benchmarks as well as client-owned benchmarks and index calculation. The oversight function is part of the organizational structure of Morningstar but is separate and independent from the index business, index management, and the other index committees.
